Medication reconciliation at discharge

To decrease errors on discharge and during transition of care by carrying out the following steps:

1. **Verify:** collect a current medication list.
 2. **Clarify:** make sure the medications and doses are appropriate.
 3. **Reconcile:** compare new medications with the list and document changes in the prescriptions for medication.
 4. **Transfer:** communicate the updated and verified list to the appropriate caregivers and to the patient.
- However, research showed that medication reconciliation was only performed for **44%** of all discharged patients⁵.

Medication
related
problems occur
at 15-49% of all
hospital
discharges¹⁻⁴

Research objective

To reveal possible **discrepancies** between **guidelines/hospital protocols** (work-as-imagined) and **clinical practice** (work-as-done) for the process of medication reconciliation at discharge.

This could explain when and why healthcare professionals deliberately or accidentally deviate from these protocols.

Methods

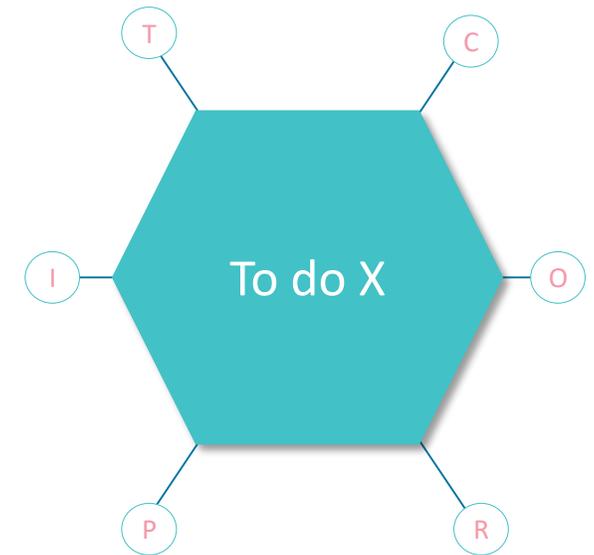

- **Document analysis** work-as-imagined → National guidelines & hospital protocols
- **Interviews** work-as-done → 8 HCPs (physicians, nurses and pharmacy technicians)
- **Feedback meeting** results → Online or on location

➤ Participants: 9 cardiology and orthopedics wards from 8 Dutch hospitals.

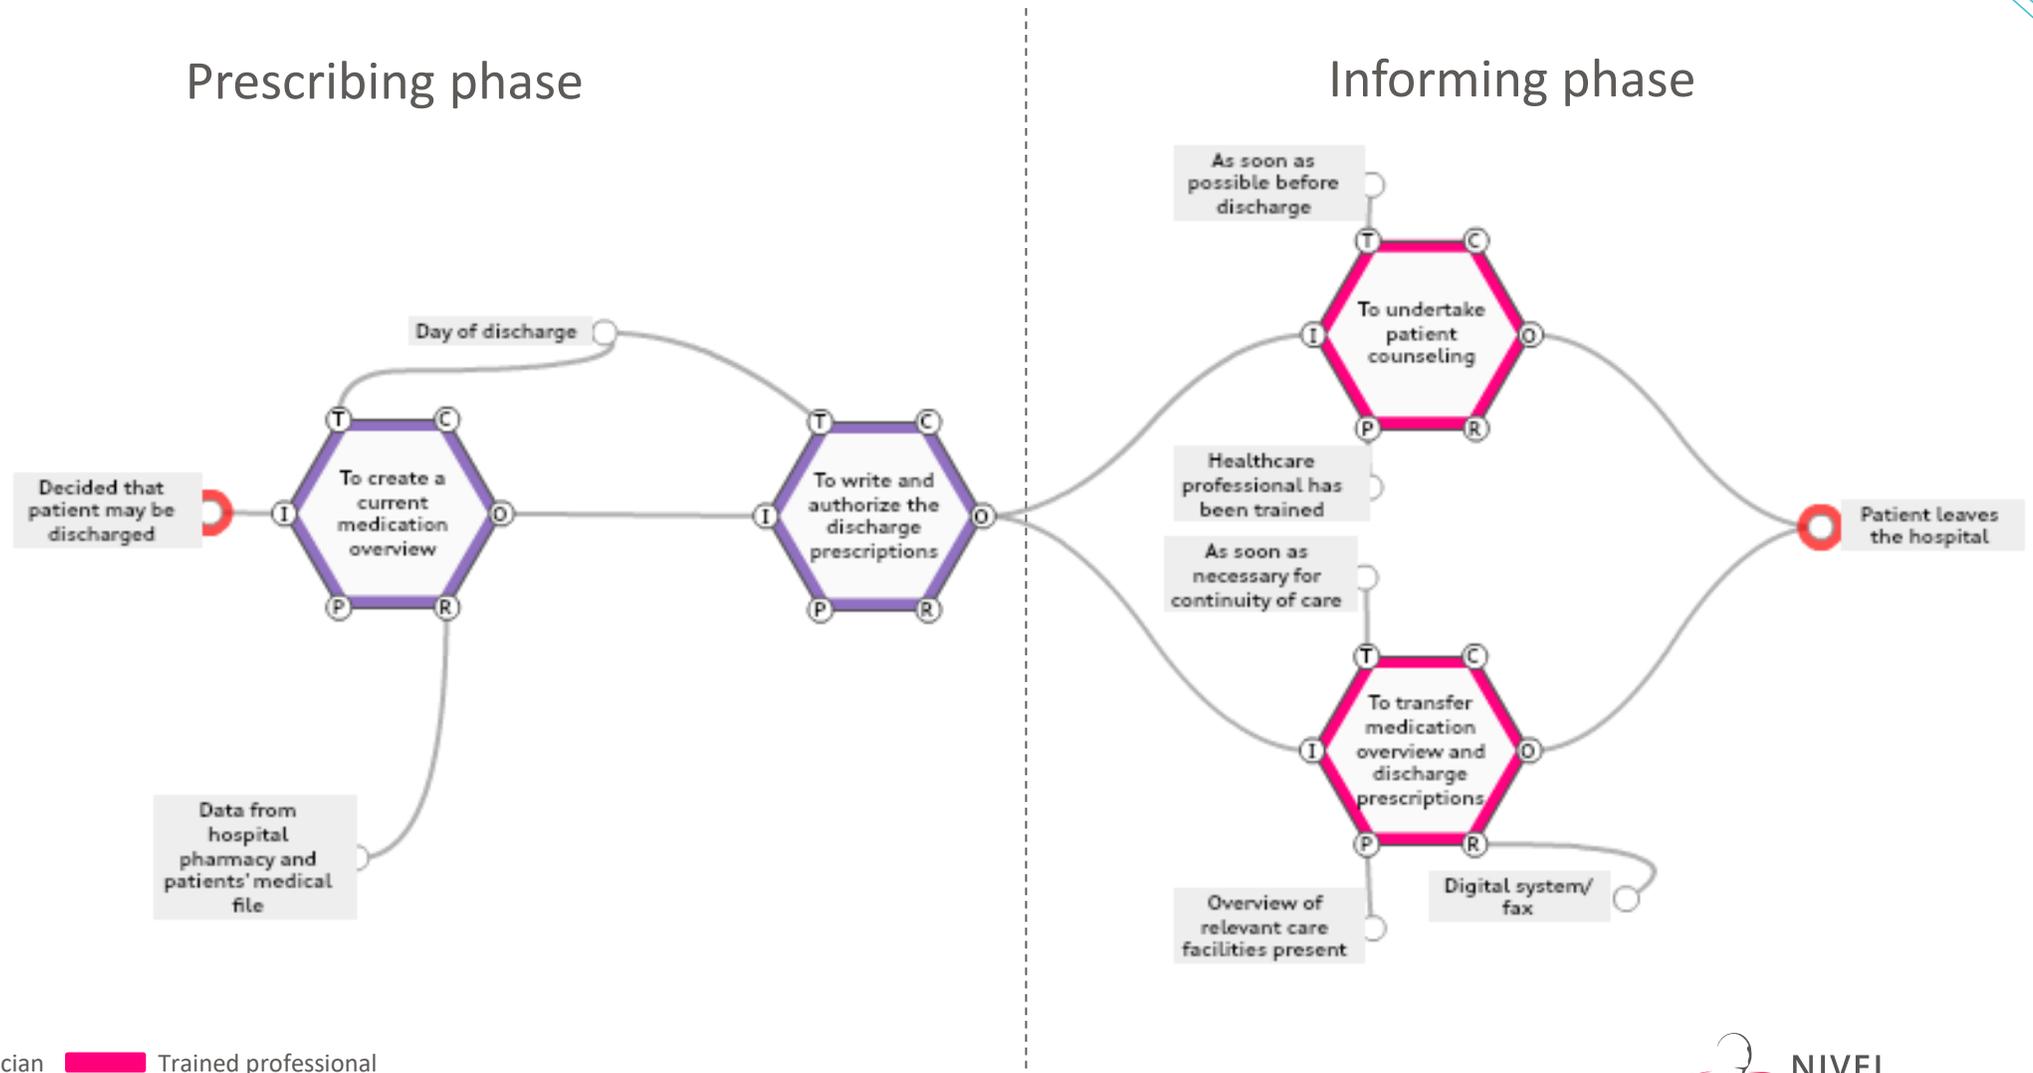

Functional Resonance Analysis Method (FRAM)

- There may be misalignment between guidelines and daily practice.
- Guidelines do not regard varying conditions in everyday practice.
- HCPs have to adjust their performance (i.e. be resilient) to provide care safely → **practice variability**.

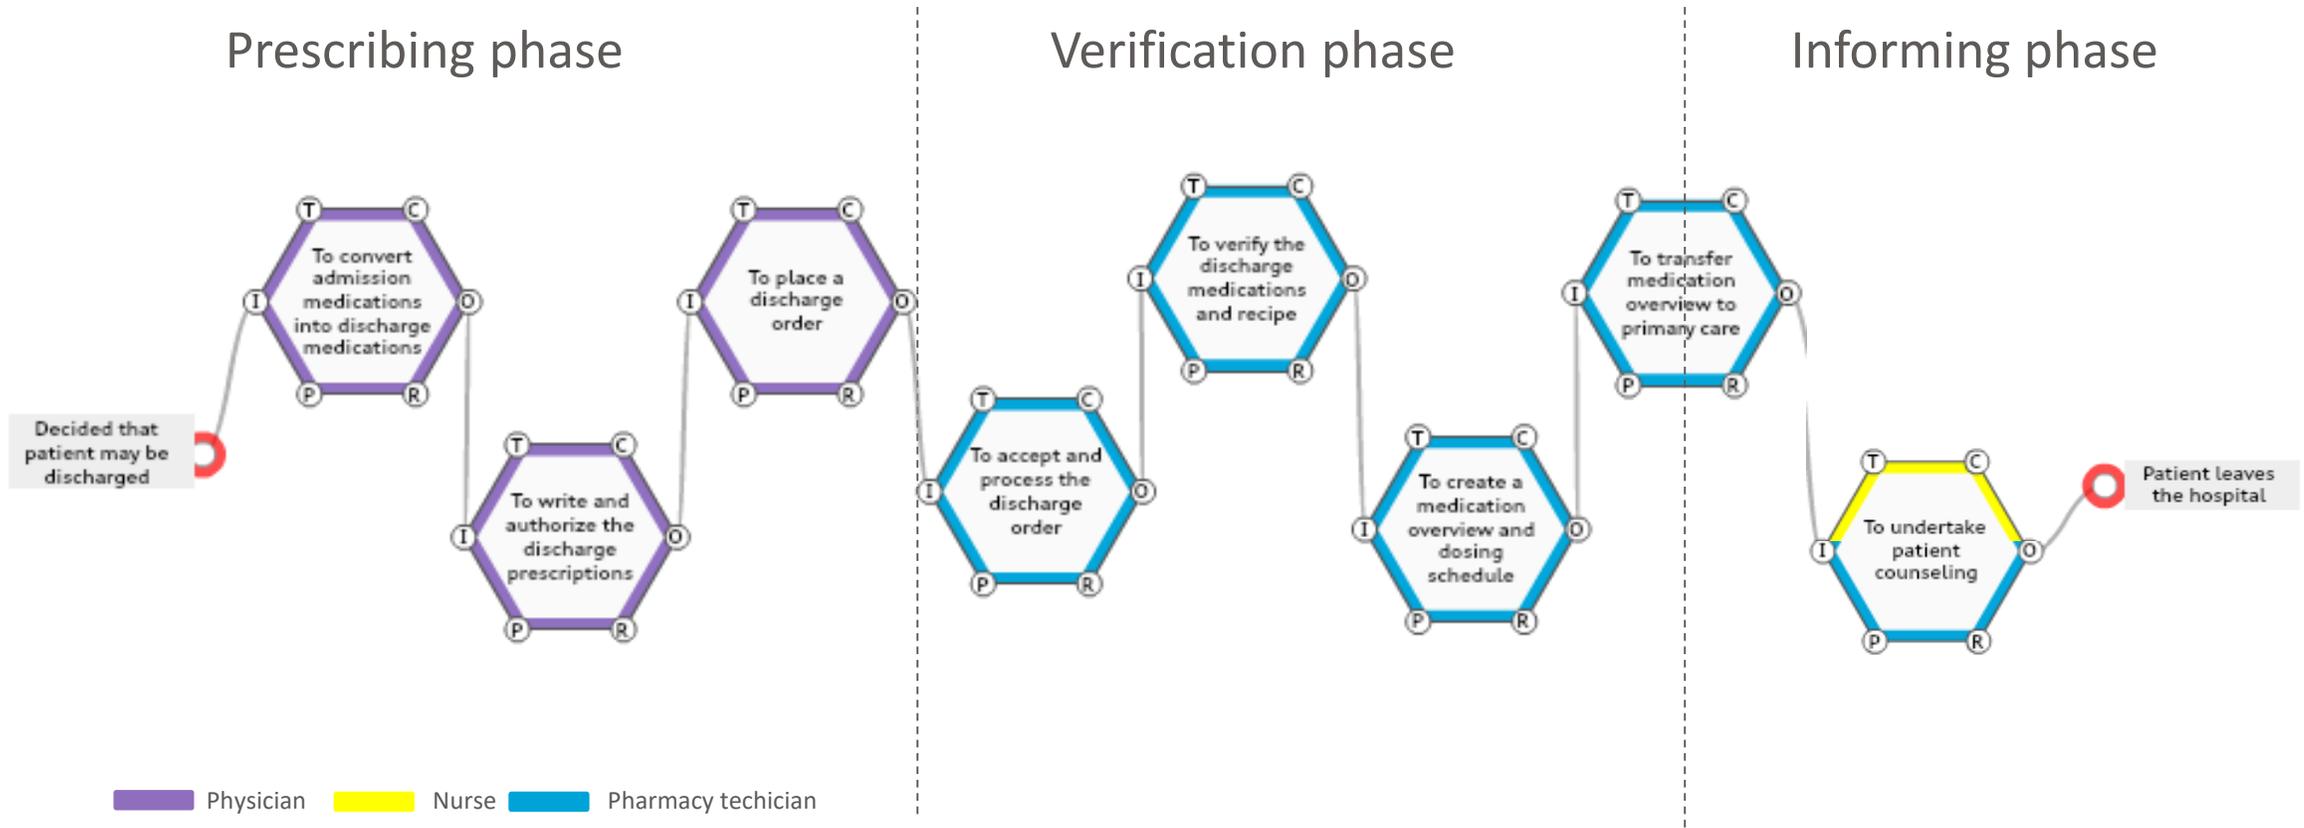

The **Functional Resonance Analysis Method (FRAM)** helps to visualize the 'process as-Imagined' and the 'process as-Done'. This could enable the dialogue between HCPs to learn from each other.

Work-As-Imagined national guidelines

General Work-As-Imagined model

Prescribing phase

Verification phase

Informing phase

Physician Physician and nurse Nurse Pharmacy technician

Variability

Comparing WAD to WAI

- More involved healthcare professionals.
- More proceedings were carried out and in a different order.
- Non-linear process.

Considerations by HCPs

- When to perform a certain activity.
- How thoroughly to carry out a activity.

Conclusion

- Several adjustments were made to
 1. translate the national guidelines into hospital protocols.
 2. make the protocols workable in practice.
- Medication reconciliation at discharge is a complex process.
- HCPs sometimes deliberately deviated from protocols to succeed under varying conditions.
- Follow-up studies could focus on the effects of practice variability on patient experiences and patient safety.
